

FROM LEGACY SAS TO A TRUSTED MODERN SYSTEM

The business problem is loan-default scoring. The engineering problem is preserving meaning while changing the platform.

WORKED STORY · Loan Default Scoring · LC-LOGIT-01

A THE BUSINESS STORY

B WHY ONE-SHOT TRANSLATION FAILS

C THE JOURNEY

D SIX OPERATING BEHAVIORS

HUMANS OWN · business meaning · architecture · success criteria · merge · release

The agent is not the decision-maker. It is a disciplined participant in an evidence-driven engineering system.

NEXT → Roles, skills, artifacts, and gates.

ROLES • SKILLS • ARTIFACTS • GATES

Reliable agents are designed as a system of bounded responsibilities—
not one powerful prompt.

✓ WORKED STORY · Loan Default Scoring · LC-LOGIT-01

A ROLES ARE PERMISSION BOUNDARIES

ORCHESTRATOR

- orders stages, state, limits, handoffs
- never invents business semantics

ANALYST

- discovers, specifies, traces, models
- does not mutate implementation

MAKER

- generates, tests, adapts, repairs
- cannot change success or self-approve

EXPLORER

- ingests evidence, diagnoses
- does not edit code

CHECKER

- validates and reviews independently
- does not repair during review

APPROVER

- authorizes intent, architecture, evidence changes, release
- retains accountability

B SKILLS ARE EXECUTABLE CONTRACTS

TRIGGER

ASSUMPTIONS

INPUTS

WORKFLOW

OUTPUT

VERIFICATION

BOUNDARIES

PRESSURE
EVALS

EXAMPLE · trace

trigger
SAS code + log +
LST supplied

input
fixed source

release
packet

Chat is not the system of record. Artifacts are.

D GATES CONTROL PROGRESS

1
alignment
approved

2
specification
complete

3
architecture
decided

4
semantics
reconstructed

5
implementation
evidence passes
SAS/Python parity

6
selected runtime
proven

7
human release
decision

E ANTI-RATIONALIZATION

"It is obvious."
→ Write the SPEC.

"The code looks right."
→ Execute the gate.

"The deadline cannot move."
→ Do not tedefine success.

A skill is trustworthy when its inputs, boundaries, evidence, and stop conditions are explicit.

NEXT → See the skills execute, one handoff at a time.

HOW THE SKILLS EXECUTE

Each skill does one job, writes one durable artifact, and hands off only after its gate passes.

orchestrate · prerequisites · state · worktrees · limits · resumability · handoffs | Controls the journey: does not invent business meaning.

A ACT 1 · ALIGN

B ACT 2 · REUSE AND RECONSTRUCT

i Imported patterns inform; they never override the SPEC.

C ACT 3 · BUILD AND PROVE LOCALLY

D ACT 4 · ADAPT AND OPERATE

E ACT 5 · IMPROVE THE SYSTEM

F EVERY SKILL FOLLOWS THE SAME CONTRACT

FAILURE ROUTING (EXAMPLES)

⚠ Repair the earliest failed gate—not the easiest visible symptom.

The sequence prevents discovery, implementation, checking, and approval from collapsing into one unreviewable act.

NEXT → Recover safely, learn deliberately, scale governance.

WORKED STORY · Loan Default Scoring · LC-LOGIT-01

RECOVER SAFELY · LEARN DELIBERATELY · SCALE GOVERNANCE

A loop is useful only when its goal, evidence, boundaries, and stop conditions are explicit.

A BOUNDED ENGINEERING LOOP

⚠️ STOP when the same failure repeats twice without new evidence.

📄 LC-LOGIT-01 · import failure → inspect log → classify metadata → patch ingestion → rerun → regression guard

B PRESSURE TESTS MAKE CULTURE EXECUTABLE

Discipline is what survives deadline and authority pressure.

C LEARNING WITHOUT CARGO CULTING

One occurrence is a lesson. Repeated evidence may become a standard.

D LEADERSHIP OPERATING MODEL

E OUTCOMES OVER ACTIVITY

F DEFINITION OF DONE

✓ intent approved · semantics explicit · evidence passed · runtime proven · independent review · human decision · rollback ready

🎯 Agent mastery is engineering culture rendered as executable instructions, evidence gates, and pressure-tested behavior.

➡ START WITH ONE TRACER BULLET → PROVE THE OPERATING MODEL → LEARN → SCALE MODULE BY MODULE
